

Osiris Tuner is a complete ECU re-mapping system for those who are capable of tuning their own vehicles — the best alternative to standalone ECU and piggyback products.

Our software is easy to install from any Windows-based computer. With no downtime, it will flash most Nissan and Infinity models (2003 and newer) in less than 60 seconds. This pre-tuned setup can then be further customized by UpRev or an authorized UpRev Pro Tuner.

Osiris Tuner includes the Cipher cable; a data logging and diagnostic tool, for plug-and-play connectivity. After installation, attach the cable into your vehicle's OBDII port, then run the app for fast re-flashing. Features include on-the-fly map switching (using the cruise control buttons) and forced induction capabilities.

UpRev is an established leader in the tuning industry. With hundreds of dealers and professional tuners using our products worldwide, local support is easy to find. Home garage hobbyists, hardcore racers and professional shops alike trust our full range of products to shape engine characteristics with advanced recalibration.
